(a) v3 error at 34 bps (sent 0 after a 1; dev run 18:09:57): shaded = sent 1, dashed = v3 bit window
|delta| node Y3 (counts)
raw samples (own timestamp)
v3 interpolated grid values
interpolated ON/OFF mixture
inside the sent-0 window
Time relative to the error bit's true start (ms; transmitter edge + measured 11-13 ms delay)
(b) Edge-averaged response: sharp step after a fixed delay, no multi-scan tail
Mean |delta| (% of ON level)
carrier OFF edge (216 edges)
carrier ON edge (192 edges)
Time since transmitted edge, host arrival time (ms)
(c) v3 'fade', 20 bps, 159.6 kHz (validation run 19:06:24): magenta box = sent 1 read as 0
Raw delta Y3 (counts)
(d) The change-based feature drops inside the strong bit; the level-based one does not
logenergy (change-based, v3 at >= 4 samples/bit)
absdev (distance from baseline)
Feature (z-score)
Time relative to the bit's true start (ms)
